Sphynxx: Parkmobile's digital solutions for enforcement and town management

Efficient parking and enforcement systems are imperative in today's society. With the ever increasing traffic, the demand for sophisticated enforcement systems becomes more pressing. Parkmobile developed Sphynxx, a comprehensive solution that can manage mounting workloads effectively, enable the councils to improve their service levels to the public and reduce operating costs.

Sphynxx offers digital management of all enforcement systems from a single central system. It is safe, efficient and cost effective.

Sphynxx: digital verification of parking

Electronic parking means that the vehicles can now be checked digitally with a hand-held terminal. A scan of the vehicle registration number, a RFID transponder card or a barcode will be all it takes. Sphynxx even offers parking status verification using a speech recognition technology; the parking attendant simply quotes the number and the status of the parked vehicle is relayed through a wireless headset.

Sphynxx: instant issuing of a parking fine

Sphynxx is a user-friendly system as parking fines can be printed out on the spot from the hand-held terminal, even the layout of the parking fine could be modified easily. All the information will be stored automatically in a secure central database.

Sphynxx: efficient clamping or removal of a vehicle

The parking attendant can use the same hand-held terminal to order a vehicle to be clamped or removed. The order is registered centrally, it is then automatically passed onto the on-board computer of the vehicle that will execute the order.

Sphynxx: a tool for town management

Sphynxx can also be used to report and register occurrences such as, defective pay & display machines, missing parking signs or broken street lights. Other features include: issuing fines for vandalising street furniture, fly-tipping or walking a dog without a leash. Photographic evidence can be generated for each instance to support the fine.

Sphynxx: streamlined administration

Sphynxx allows all registered offences to be stored and processed centrally. As the system could be linked to many other external systems, it offers functionalities such as, fine collections, appeals management, as well as debt collection and management.

Sphynxx: secure and proven

Sphynxx is developed by Parkmobile Group and Simac Techniek N.V.; it is used by over a thousand satisfied parking attendants throughout Europe every day. This system is secure, user-friendly and 100% fraud-proof.

Sphynxx: always up to date

- changes can be made centrally and updated onto all the hand-held terminals automatically;
- real-time communication between the central control and the hand-held terminals;
- automatic prevention of a fine being issued twice for the same offence;
- offers as standard an integral logging system which means that every transaction will automatically be stored.

Sphynxx: maximum flexibility and future-proof

- updates can be carried out easily and inexpensively to the council's specific requirements at any time;
- suitable for cities of different sizes as it is web-based, modular and multilingual;
- fully scalable enabling any number of users, and processing millions of transactions.
